L3 Collaboration

- $\gamma^*\gamma^*$ Physics
- Motivation (BFKL Physics)
- Cross-section Measurements
- Conclusions

$$e^+ e^- \rightarrow e^+ e^- \text{hadrons}$$

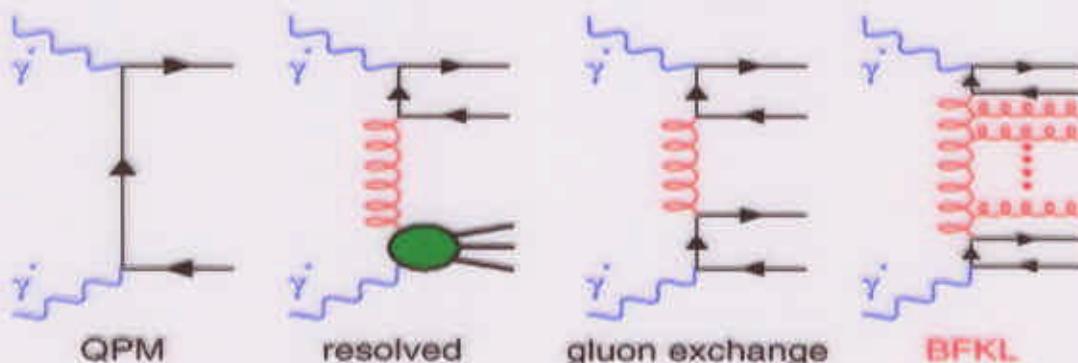

- The virtualities of photons:

$$Q^2 = -q_1^2 \simeq -q_2^2 = 2\sqrt{s} E_{tag} (1 - \cos\theta)$$
- The $\gamma\gamma$ center of mass energy

$$W_{\gamma\gamma} = \sqrt{(q_1 + q_2)^2}$$

can be measured directly from the e^\pm .
- Luminosity Monitor $\frac{\Delta E}{E} = 1.3\%$

BFKL physics and $\gamma^*\gamma^*$

- J. Bartels et al. (PLB 389 742) and S.J. Brodsky et al. (PRD 56 6957) pointed out that the **BFKL Pomeron** can be investigated in $\gamma^*\gamma^*$ collisions.
- ⇒ The BFKL diagram is dominant at **high Q^2** and **high $W_{\gamma^*\gamma^*}$** .
- In Leading order at **saddle point** approximation :

$$\sigma_{\gamma^*\gamma^*} = \frac{\sigma_0}{\sqrt{Q_1^2 Q_2^2 Y}} \left(\frac{s}{s_0} \right)^{\alpha_P - 1} \simeq \frac{\sigma_0}{\sqrt{Q_1^2 Q_2^2 Y}} \left(\frac{W_{\gamma^*\gamma^*}^2}{Q^2} \right)^{\alpha_P - 1}$$

$$s_0 = \frac{K \sqrt{Q_1^2 Q_2^2}}{y_1 y_2}, \quad y = 1 - (E_{tag}/E_b) \cos^2(\theta_{tag}/2)$$

$$\alpha_P - 1 = 4 \ln 2 \frac{N_c \alpha_s}{\pi}, \quad Y \approx \ln \left(\frac{W_{\gamma^*\gamma^*}^2}{\sqrt{Q_1^2 Q_2^2}} \right)$$

Using $N_c = 3$, $\alpha_s = 0.2$ ($\Lambda_{\text{LO}} = 0.16 \text{ GeV}$, $Q^2 = 15 \text{ GeV}^2$)

$$\alpha_P - 1 \simeq 0.53 > 0.094 \text{ ("soft Pomeron")}$$

NLO BFKL

- NLO corrections to $\alpha_P - 1$:
 - NLO corrections are negative.
 - $\alpha_P^{NLO} - 1 < 0$ when $\alpha_S > 0.16$.

- Improve resummation :

- NLO BFKL + BLM optimal scale
(Brodsky, Fadin, Kim, Lipatov and Pivovarov, hep-ph/9901229)
- Color dipole BFKL
(Nikolaev, Speth and Zoller, hep-ph/0001120)
- Double logs resummations
(Ciafaloni, Coggerai and Salam, PRD 60, 114036)

$$0.17 < \alpha_P^{NLO} - 1 < 0.33$$

Used data and MC

□ Data :

$$\frac{\sqrt{s} \quad < Q^2 > \quad \int \mathcal{L} dt}{}$$

189–202 GeV	15 GeV^2	401 pb^{-1}
183 GeV	14 GeV^2	52 pb^{-1}
91 GeV	3.5 GeV^2	140 pb^{-1}

L3 collab., Phys. Lett. B 453 (1999) 333

□ Monte Carlo :

PHOJET: Engel and Ranft
(Phys. Rev. D54 4246 (1995))

TWOGAM: Nova, Oleshevski and Todorov

JAMVG: J.A.M. Vermaseren
(Nucl. Phys. B229 347 (1983))

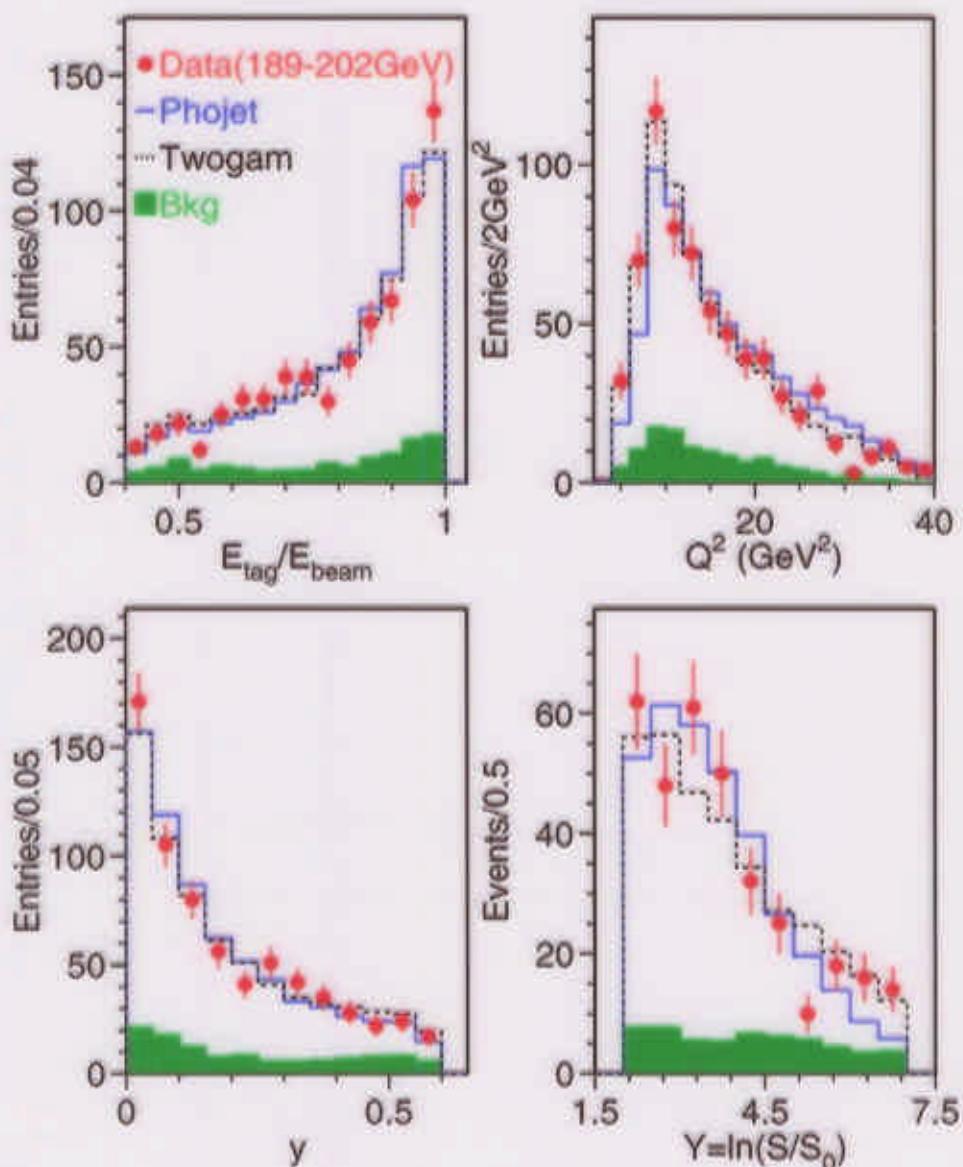

PHOJET and **TWOGAM** reproduce quite well single-tagged and untagged events using the parton density function of the photon (GRV)

JAMVG describes the direct process $\gamma\gamma \rightarrow q\bar{q}$

Event selection $e^+e^- \rightarrow e^+e^- \text{hardons}$

- Two tagged electrons are identified :
 - $E_{tag} > 40 \text{ GeV}$
 - $30 \text{ mrad} < \theta_{tag} < 66 \text{ mrad}$ (Luminosity Monitor)
 - $2 < Y < 7$; $Y = \ln\left(\frac{s}{s_0}\right) \approx \ln\left(\frac{W^2}{Q_1^2 Q_2^2}\right)$
- Backgrounds :
 - $e^+e^- \rightarrow e^+e^-\tau^+\tau^- \approx 6.3\%$
 - misidentified single-tag two-photon events $\approx 9.3\%$
 - $e^+e^- \rightarrow q\bar{q} \approx 1\%$

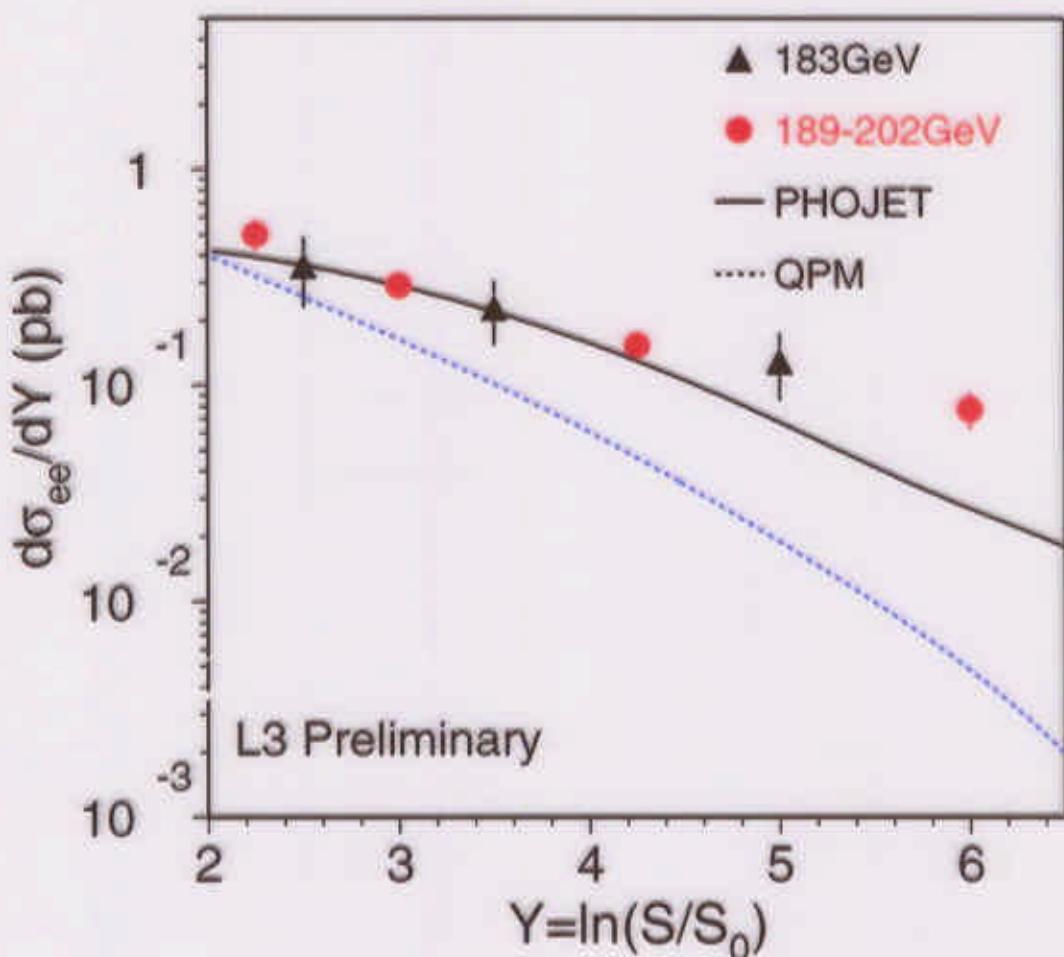

L3: MC/Data

- ❑ Reasonable agreement with PHOJET and TWOGAM.
- ❑ Select :
 - 137 events at 91 GeV ($\langle Q^2 \rangle = 3.5 \text{ GeV}^2$)
 - 34 events at 183 GeV ($\langle Q^2 \rangle = 14 \text{ GeV}^2$)
 - **336 events at 189-202 GeV ($\langle Q^2 \rangle = 15 \text{ GeV}^2$)**

$$\sigma(e^+e^- \rightarrow e^+e^- hadrons)$$

$\sigma(e^+e^- \rightarrow e^+e^- hadrons)$ in defined phase space.

□ L3 :

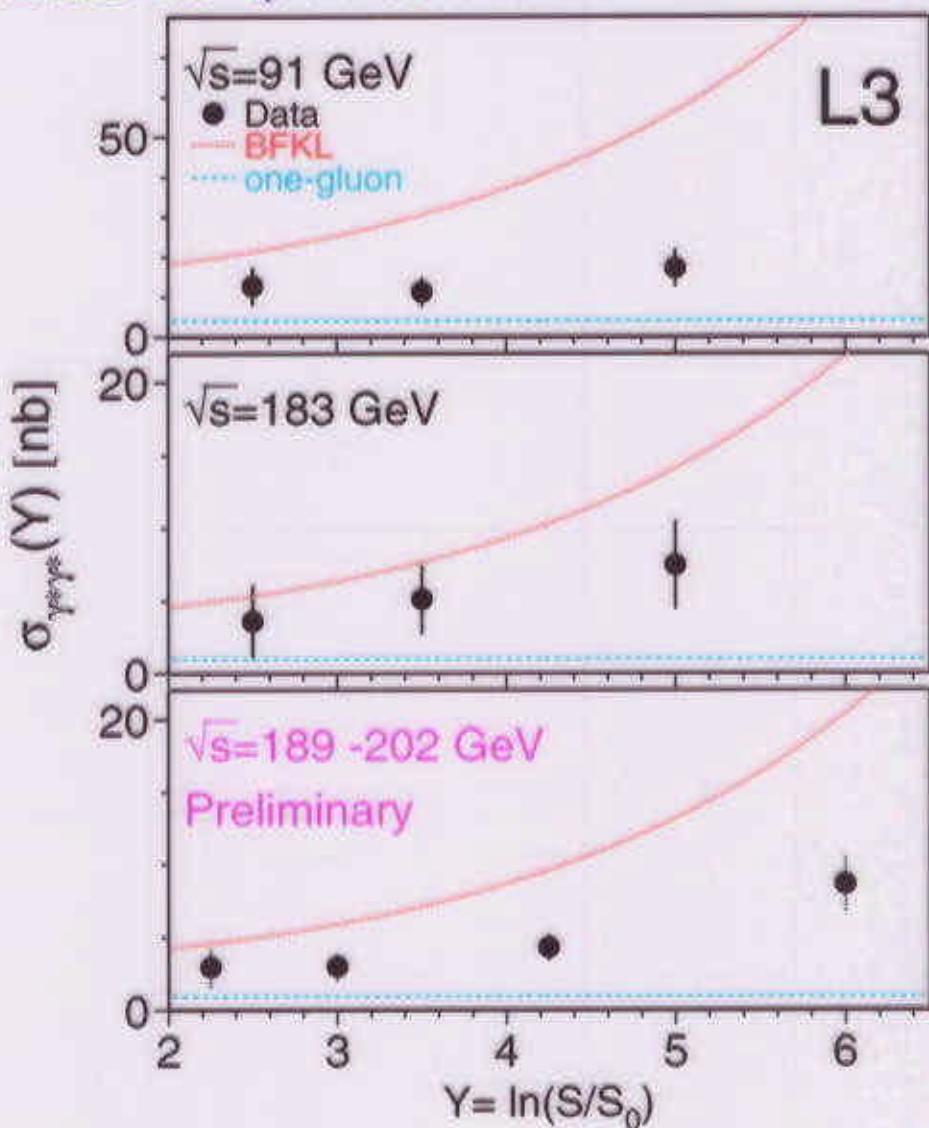

→ QPM is insufficient ($\sigma_{ee} = 0.42$ pb)

$\sigma_{ee} = 0.93 \pm 0.05 \pm 0.14$ pb (PHOJET: $\sigma_{ee} = 0.76$ pb)

- Charm production is suppressed in PHOJET due to high p_t^{cut} .
- At $5 < Y < 7$, cross section exceeds $\approx 3.5\sigma$ above the prediction
- Opens a room for BFKL

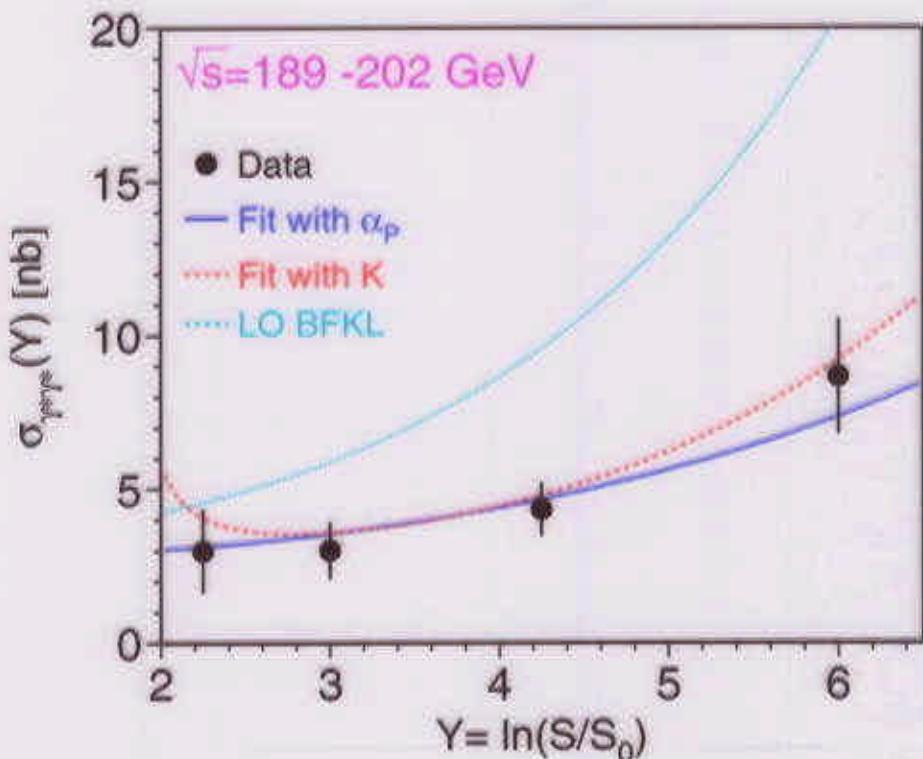

$\gamma^*\gamma^*$ collisions

- $\sigma_{ee} = \mathcal{L}_{TT} \times \sigma_{\gamma^*\gamma^*}$
- Subtract the QPM contribution.

- Rise of $\gamma^*\gamma^*$ cross-section is observed
- One gluon exchange process is insufficient.
- LO BFKL prediction (saddle point approx.) is too high.

$\gamma^*\gamma^*$ collisions

□ Fit with

$$\sigma_{\gamma^*\gamma^*} = \frac{\sigma_0}{Q^2 * \ln[s/(K \times s_0)]} \left(\frac{s}{K \times s_0} \right)^{\alpha_P - 1}$$

→ α_P is free parameter and $K = 1$.

$$\alpha_P - 1 = 0.36 \pm 0.02 < 0.53 \quad \chi^2/\text{dof} = 0.98/3$$

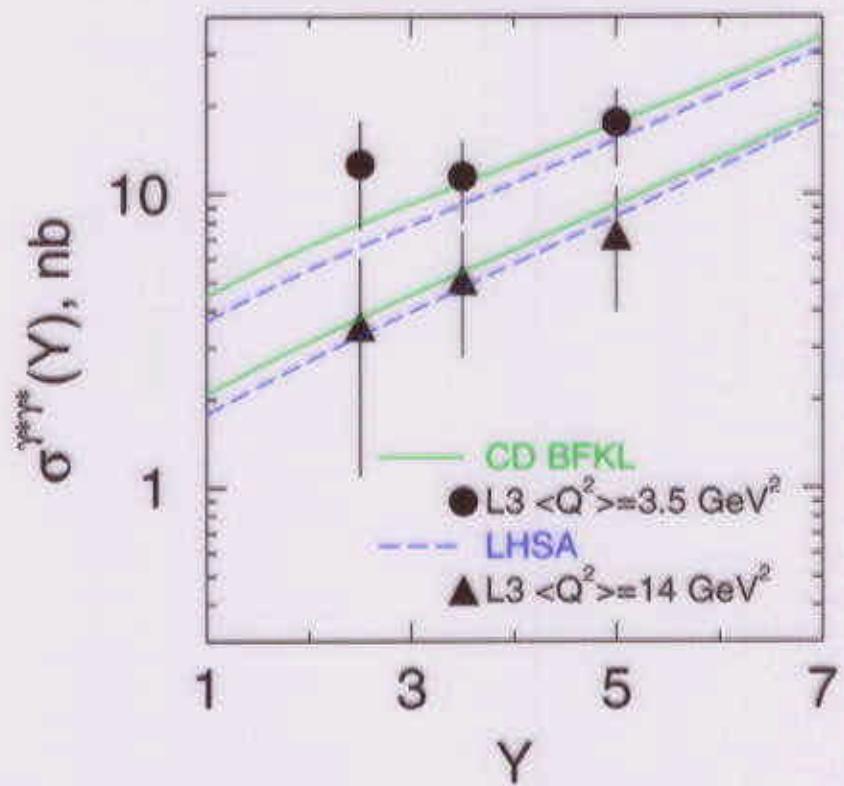

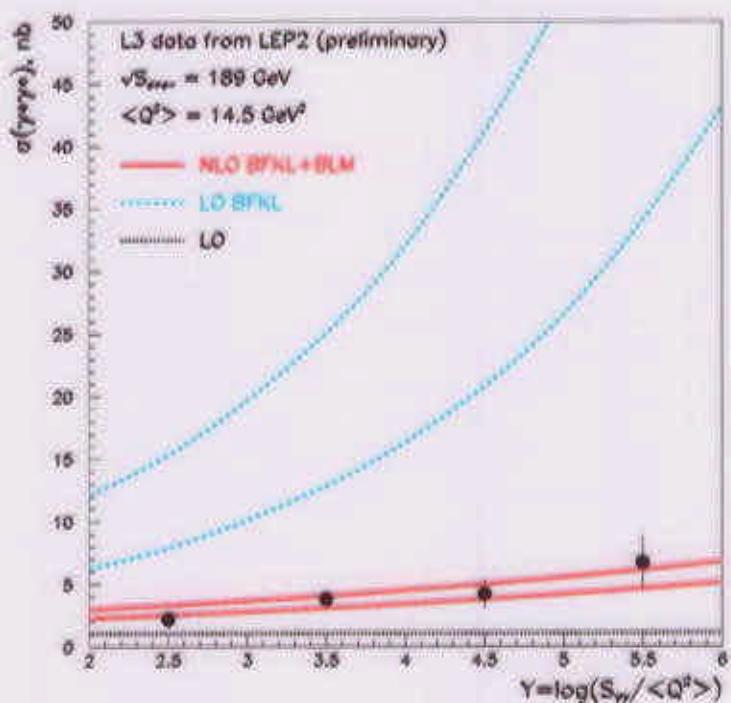

$$\alpha_P^{NLO} - 1 = 0.29 - 0.31 \quad (Q^2 = 14 \text{ GeV}^2)$$

(Ciafaloni, Colferai and Salam, PRD 60, 114036)

→ K is free parameter and $\alpha_P - 1 = 0.53$

$$K = 6.4 \pm 1.0 > 1 \quad \chi^2/\text{dof} = 1.34/3$$

NLO BFKL

→ Agree with the data !

Conclusions

- $\gamma^*\gamma^*$ collisions have been measured up to $\langle Q^2 \rangle = 15 \text{ GeV}^2$ and
$$Y \approx \ln\left(\frac{W_{\gamma^*\gamma^*}^2}{\sqrt{Q_1^2 Q_2^2}}\right) = 7 \text{ at L3}$$
- The QPM is not sufficient to describe the data
QCD diagrams are necessary.
- Agreement between data and PHOJET Monte-Carlo model using
GRV-LO parton density function is reasonable for $Y < 5$
→ $\approx 3.5\sigma$ above the prediction $5 < Y < 7$
- Cross-sections of $\gamma^*\gamma^*$ collisions
 - ↳ LO BFKL predicts too large cross-sections
→ sensitive to the energy scale s_0 .
 - ↳ Improved NLO BFKL calculations are necessary.
